

Research Assistantship in Stroke Imaging

A large dataset (>1000) of patients with stroke, who has gone under cerebral angiography, with or without intervention in addition to clinical evaluation and follow up exists for analysis. This will be a golden opportunity for a resident or an intern to use as his/her thesis and produce an excellent publication. You need to spend at least 1 day per week on this project. The successful candidate will be remunerated according to IPM research assistantship scale and based on the number of hours (max 64 hours per month) spend on the project.
